TWO STROKE CYCLE ENGINE (PETROL ENGINE) In two stroke cycle engines, the whole sequence of events i.e., suction, compression, power and exhaust are completed in two strokes of the piston i.e. one revolution of the crankshaft. There is no valve in this type of engine. Gas movement takes place through holes called ports in the cylinder.

A two-stroke engine is a type of internal combustion engine that completes a power cycle with two strokes of the piston during only one crankshaft revolution. This is in contrast to a "four-stroke engine", which requires four strokes of the piston to complete a power cycle during two crankshaft revolutions. In a two-stroke engine, the end of the combustion stroke and the beginning of the compression stroke happen simultaneously, with the intake and exhaust functions occurring at the same time. T

A 2 stroke spark ignition cycle or 2 stroke petrol engine differs from a 4 stroke petrol engine by the way it generates power in the number of revolutions of the crankshaft. Unlike in a 4 stroke petrol engine, the 2 stroke spark ignition cycle produces power in each of its revolutions. The 2 stroke spark ignition gives way to the traditional four strokes to run its complete cycle. Instead, it merges two strokes into one; thereby making one upward stroke and one downward stroke in every ...
