Hi, and welcome to this video on cell replication, otherwise known as mitosis or meiosis. First, let's start with mitosis. The primary events that occur during mitosis are interphase (the cell prepares for division by replicating its genetic and cytoplasmic material). Interphase can be further divided into G1, S, and G2.

What does meiosis create? Start with 46 and the first division duplicates the chromosomes to 92 then splits them between 2 new cells (with 46 each). The second division splits each of the new cells in two for a total of 4 with 23 chromosomes each. How does the number of chromosomes change during meiosis?

We have mentioned two types of nuclear division: mitosis, where the nucleus divides into two identical nuclei, and meiosis, which results in the production of four nuclei with half the original number of chromosomes of the parent cell.

Overview of Meiosis Meiosis is a two-part cell division process in organisms that sexually reproduce. Meiosis produces gametes with one half the number of chromosomes as the parent cell. In some respects, meiosis is very similar to the process of mitosis, yet it is also fundamentally different from mitosis.

Two major phases of meiosis occur: meiosis I and meiosis II. During meiosis I, a single cell divides into two. During meiosis II, those two cells each divide again. The same demarcating phases of mitosis take place in meiosis I and meiosis II—prophase, metaphase, anaphase, and telophase—but with some variations contained therein.
