Welding, Cutting and Heating guide

When cutting, the metal is first heated by the flame until it is cherry red. Once this temperature is attained, oxygen is supplied to the heated parts by pressing the oxygen-blast trigger. This oxygen reacts with the metal, producing more heat and forming an oxide which is then blasted out of the cut. It is the heat that continues the cutting process.

Sizing and standardizing cutting, welding, and heating tips can be a real challenge because manufacturers assign numbers to their tips that have no relationship to bore size, material thickness, or anything else (see Figure 5). For example, Manufacturer A may call a tip that cuts 1/2-inch steel a Number 1, while Manufacturer B calls it a Number 2, even though both have the same oxygen drill size of about 0.038 inch.

When starting a cut in steel away from the edge, pierce a hole through the metal to start the cut (Figure 7.3). To do this, heat a spot to cherry red, raise the torch ½-inch or more above the normal position for cutting to prevent slag from being blown against and fouling the tip, and slowly press the cutting-oxygen lever.
